. CloudComputingforMachineLearningandCognitiveApplicationsMITPressdownloadpdf One of the most important and easiest ways to prove that the data is accurate is to confirm that the data for your graph is correct, especially when your graph is provided by a client or another third party. You can do this by comparing your graph data (in this case, the CSV file that contains your data) against the expected result. In the case of and the CSV file linked above, you can compare the graph and the CSV to verify that your data is accurate. First, you'll need to open up the CSV file in a text editor. In the file's first row, you'll see a column named "graph", which specifies the graph data you're comparing. In order to do a side by side comparison of the CSV file and the graph, you can click on the "right-click" menu to open the "View" menu. From there, you can open up the "Compare with" menu. To verify that you're seeing the graph data that you'd expect, the CSV will need to match the image of the graph that you see when you open up the file. Just like in the graph, you'll want to verify the information that you enter into the cells of the CSV. For example, you can verify that the data you entered in the "Name" column matches the data that you see in the "Name" column. In addition, you may want to verify that the columns name match what's recorded in the "Name" column, as well as the type of data that's recorded. You can even do a comparison of the color scale of the graph. If you don't see a "compare with" option, you may be using a different text editor from the one that you originally opened the file in. In that case, you should try opening up the text editor you used in the first place and try again. You can also copy the text of the CSV into a new text editor and make sure the text matches up. A final note about these types of data verification is that they can be very time consuming. In the case of my graph, I spent the better part
