I have a class that encapsulates an object with an owner reference: public class Ref { private readonly T reference; private readonly U owner; } And I'd like to ensure that there is no cycle in the ownership graph, so that there is no way to construct a Ref with the same owner and a different reference. This could be accomplished with a getter that checks for cycles: public T Owner { get; private set; } public U Owner { get; private set; } public Ref AsRef() { if (Owner!= null) throw new InvalidOperationException("A cycle was detected with Owner, " + Owner.ToString() + "." + "It must be possible to set Owner."); if (Owner == null) throw new InvalidOperationException("A cycle was detected with Owner, " + Owner.ToString() + "." + "It must be possible to set Owner."); return new Ref(Owner, reference); } But I'm wondering if I'm just creating a function with an unintended side effect. A: If this is immutable, you could enforce that this is always called on a copy of the owner f678ea9f9e
